Instructions for the machine-assisted human translation task

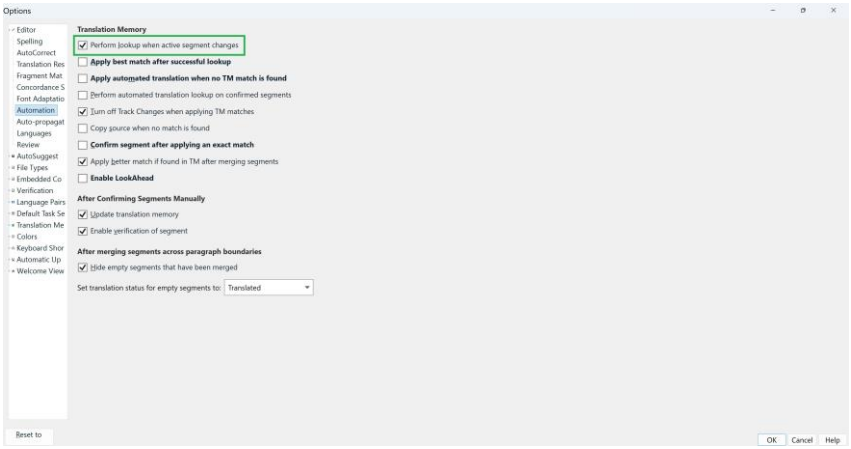

Thank you very much for your help with this study. Please **read the following instructions carefully** before working on this project in Trados for the data collection.

This is a **machine-assisted human translation task**: please translate as you would normally do, with the option to check the MT results in the TM included to this project and use them in those cases you see fit. Do not consult online machine translation websites, such as DeepL or Google Translate, even for parts of the segments. The language combination is English (United Kingdom) to Spanish (Spain).

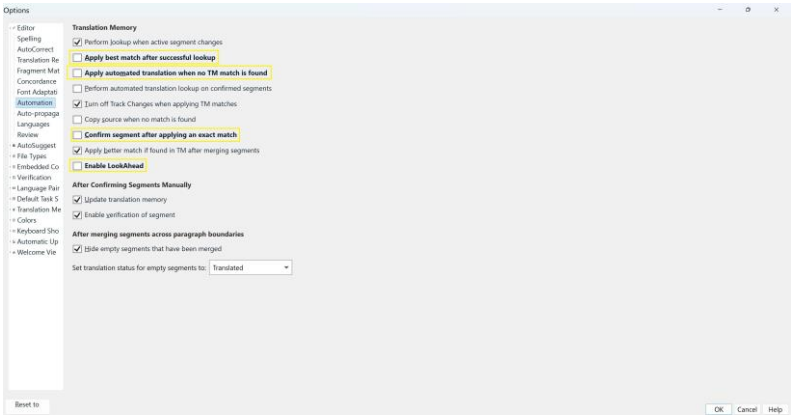

One hour after the start of the project, you must send the translated files to the researcher via email (to ariana.lopezp@autonoma.cat), following the instructions below.

Before starting the task

- Do not pretranslate the Trados project at any moment.
- In Trados, in the upper bar, click on "File" > "Options" > "Editor" > "Automation", make sure that the following options are set as follows:
  - "Perform lookup when active segment changes" is **marked**.

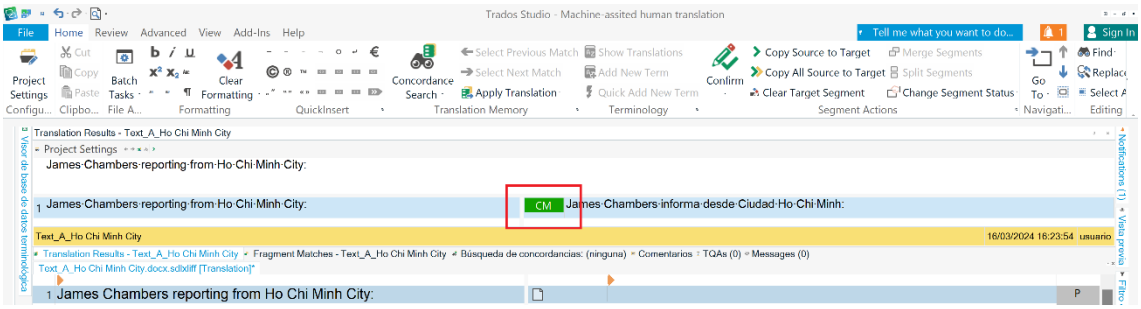

- In the same window in Trados (in the upper bar, click on "File" > "Options" > "Editor" > "Automation"), make sure that the following options are set as follows:
  - "Apply best match after successful lookup" is **unmarked**.
  - "Apply automated translation when no TM match is found" is **unmarked**.
  - "Confirm segment after applying an exact match" is **unmarked**.
  - "Enable LookAhead" is **unmarked**.

  - Make sure you **click "OK"** to save these changes.

During the task

- Do not make pauses when translating. Please work in this project continuously, without interruptions.
- Open the Trados project, work on it and close the Trados editor when you finish translating.
- Work on every segment as you would normally do. Avoid making unnecessary pauses while a segment remains opened, e.g. going to the toilet.
- A TM is connected to the project at all times to ensure that the data is collected safely; do not change the TM set-up.
- There are no 100%, Context Match, fuzzy match or repetition segments in this project, i.e., the machine-translated segments in the TM might appear:
    - as 100% or Context Match (CM), in green:

    - as automated translation (AT), in blue:

  Whether the segments appear as AT or as a CM or 100%, they are machine-translated segments. You might use them in those cases you see fit.
- Do not consult online machine translation websites such as DeepL or Google Translate. Should you have machine translation resources enabled in Trados, disable them in the TM configuration or ignore them while working.
- Do not lock any segment when translating.
- The source text in Word format is provided as reference.

After finishing the task

When you finish working on each project in Trados, save the file and close the Editor view by exiting on the right corner:

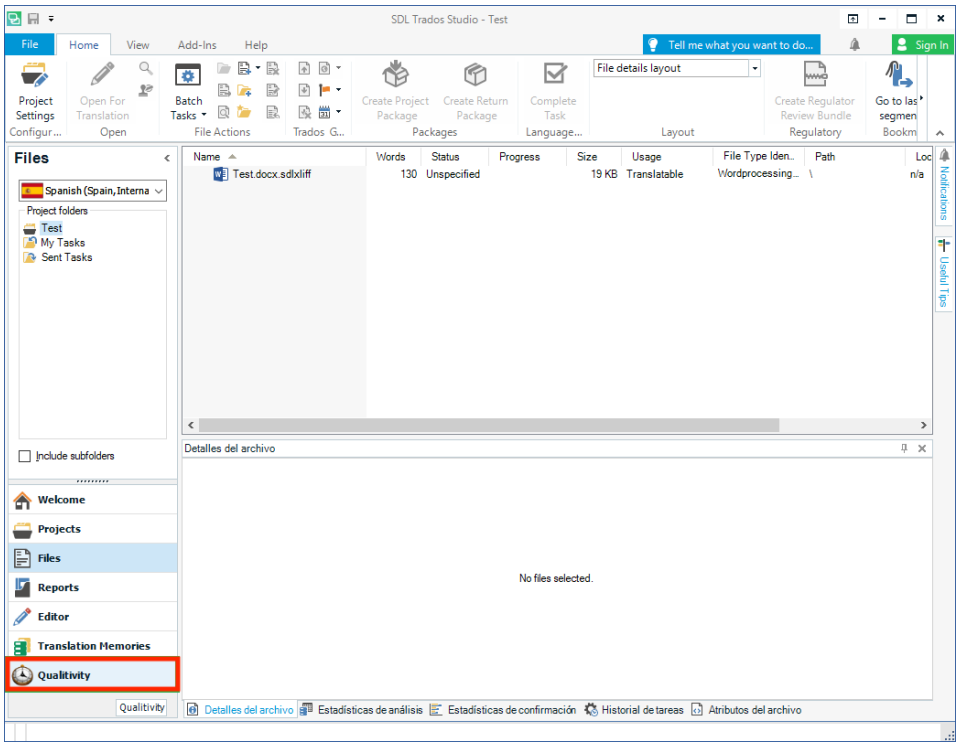

You will see the following Qualitivity pop-up window:

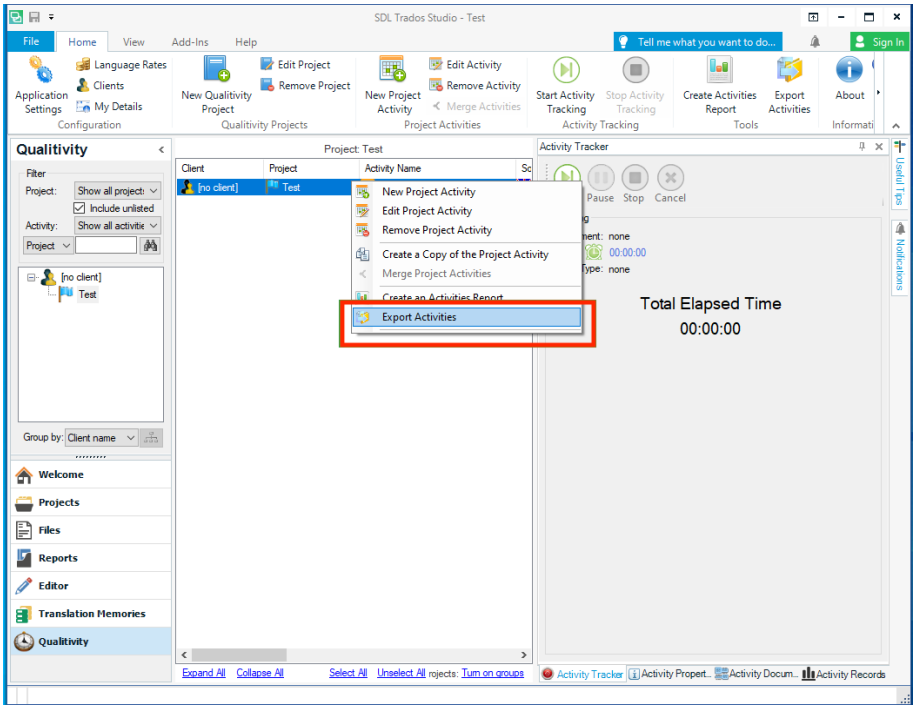

Important: **Click "OK"**. Do not click on "Cancel". Otherwise, the collected data will be lost.

Exporting the Qualitivity data in XML format

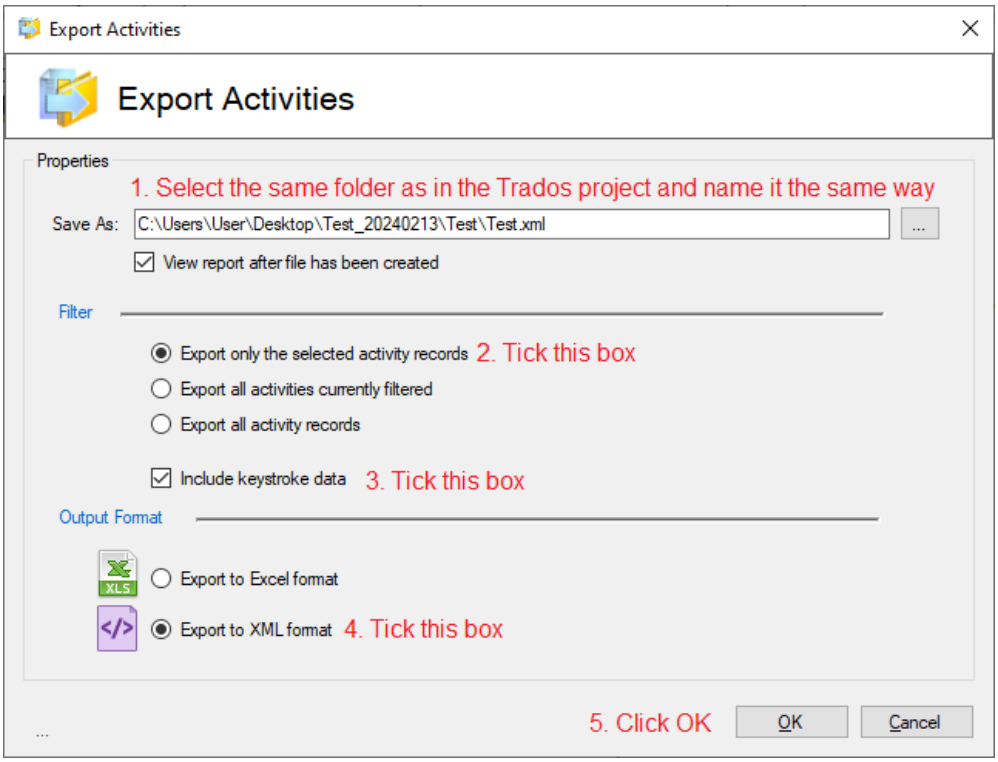

Next, export the Qualitivity activity in XML format. In order to do so, click on the Qualitivity plugin (on the bottom part of the left bar of the Trados interface):

Click on “Project Activity” and right-click on “Export Activities”:

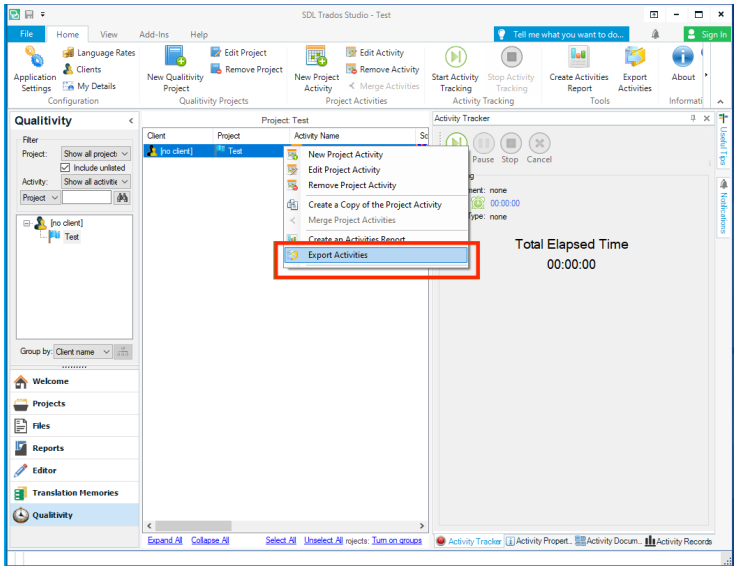

The following window will be displayed; follow the steps described in the image:

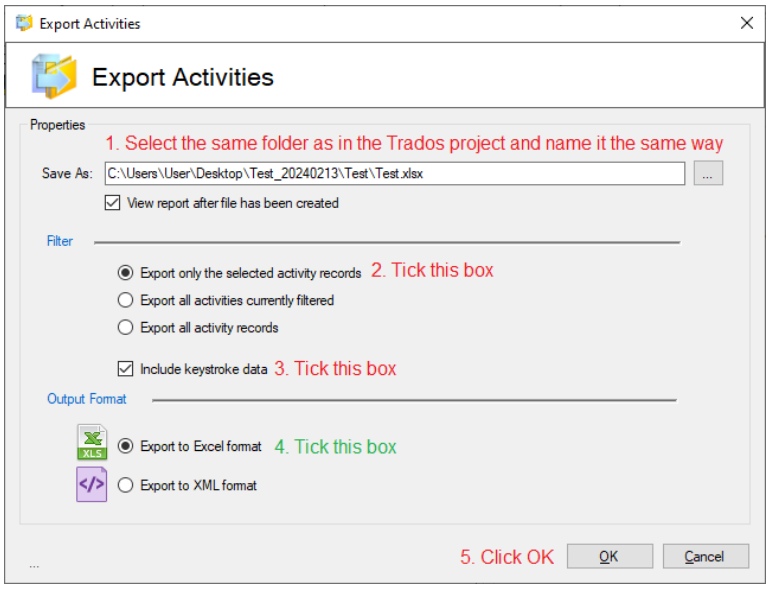

In the "Save As:" field, select the same Trados folder as in the translation project and name the Qualitivity export file the same way. In "Filter", select "Export only the selected activity records" and tick the "Include keystroke data" box. In "Output Format", select "Export to XML format". Lastly, **click "OK"**. This window will remain open until you click "Cancel".

Exporting the Qualitivity data in XLSX format

Please repeat the steps in order to export the file as an XLSX file: select the "Project Activity" and right-click on "Export Activities".

The following window will be displayed; follow the steps described in the image:

Browse for the Trados folder and name the Qualitivity export file the same way > select "Export only the selected activity records" > tick "Include keystroke data". In "Output Format", select "Export to Excel format". Lastly, **click "OK"**.

Deliverables

Please send via email (to ariana.lopezp@autonoma.cat) the following files in a zipped folder:

- The whole Trados folder with the translated files and the TM folder.
- The XML Qualitivity export file.
- The XLSX Qualitivity export file.

Should you have any doubt, please contact the researcher, Ariana López Pereira, either via email (ariana.lopezp@autonoma.cat) or phone number (+34 606353271). Once again, thank you very much for your help!
